Solution Overview

HyphaCONNECT links your front-line teams back to a central LMR core, allowing all network users to be visible to dispatch. Remote team members can use their regular talk groups even while outside of LTE and LMR coverage. Users can pass their ID, Location, Duress and Voice traffic from their standard communications equipment back to the Command Centre, giving them comfort that they remain connected and monitored.

HyphaCONNECT brings together the HyphaSATPTT or HyphaFUSION solutions with existing P25 or DMR radio networks by using a TIA-Standard Inter-RF-Subsystem Interface (ISSI), AIS or SIP. This allows users on the HyphaSATPTT or HyphaFUSION solutions to present themselves on the console as a native device of the P25 or DMR radio network – without the need for any additional terrestrial infrastructure.

HyphaCONNECT enables your truly global radio solution.
